Creating a note with an AI agent

Developer quick-sheet · Claude Code or a similar agent · version 3, 21 October 2026

The agent does the mechanical work. **You own every number, every reading and every conclusion.** Start it in the `NSDF-Data` folder and it reads `CLAUDE.md` and `AGENTS.md`, so it already knows the branch and pull request rules. This sheet pairs with the developer sheet, creating a note. Students use guide 5.

Blue: you. Purple: the agent. Teal: GitHub. Every hand-over is a point where you check its work.

Before you start: `git switch develop && git pull`, then a clean `git status` on a `feature/note-short-name` branch (no number in the branch name). The notebook is run and committed; you have its short hash.

A starting brief (fill in the brackets):

> Write the note, using the placeholder NN for its number (I will pick the number at the end), from `[notebook]`, committed at `[hash]`. Copy the structure of `docs/notes/note-02a-bstd-vs-time.html`. Save the figures from the executed notebook into `docs/notes/img/`. Pin every notebook and `python/` link to the hash and verify each with `git cat-file -e`. Add the index row, newest first, and a line under `[Unreleased]` in `CHANGELOG.md`. Every number must come from the notebook output: list any number you cannot find there. Leave the Reading and Next steps sections for me. Show me the diff and stop; do not commit or push.

The agent may draft the page from the newest note, extract figures, pin and verify links, add the index row and the changelog line, run `python -m pytest -q`, and, once you say so, commit with a `Co-Authored-By:` trailer and open the PR with `gh pr create --base develop`.

Careful

The agent must never invent, round or "fix" a number; write the Reading or the conclusion; edit a **Complete** note, another note, or their figures; run `07221203_2025_dump1_noise.ipynb`; commit data (`.bin` files, the `idx` folder); push to `master` or `develop`; or **merge a pull request**. These are the rules in `AGENTS.md`.

Your checks, before you let it commit

- ☐ Read the new page from top to bottom. Does every sentence say what you mean?
- ☐ Pick three numbers at random and find each in the notebook output.
- ☐ Does each figure look the way its caption says?
- ☐ The diff touches only: the new page, its images, one row of `docs/index.html`, one line of `CHANGELOG.md`, and the notebook. Anything else: ask why, and revert it.
- ☐ `git cat-file -e <hash>:<path>` passes for every pinned link, and the page opens from disk with working figures and links.

When it goes wrong. It says a number is checked but you cannot find it: ask for the line of output it used, and if it has none, the number is wrong. It turns your sentence into a different claim: revert that sentence and say so. It wants to edit a Complete note or generated files: refuse. A check keeps failing: paste the message, not a summary. Then push the branch, let the checks run, and merge the PR yourself. For a **student** note, the agent can run `python tools/build_notes.py check` and report, but you give the note number and merge.
